Monel Metal shafts are a
feature.

Here's one requirement of good boat building

How does a boat builder build a reputation? By building boats that represent the greatest value, as indicated by utmost dependability and longest possible service-life.

That type of boat building calls for the use of Monel Metal shafts. For Monel Metal is dependable, economical, long-lived.

Monel Metal combines rigidity, toughness and remarkable strength all in the one metal. It resists the corrosion of salt water—it will not rust. A Monel Metal shaft will not whip—it helps reduce vibration. Monel Metal shafts are supplied with a high surface finish—almost glass-like. As a result they are practically frictionless. The result is less wear on packing and bearings. They are cold-drawn to the closest commercial tolerance—they are a high grade product in every way.

If you are interested in Monel Metal—either for shafting, galley trim or hull fastenings—we suggest that you write for additional information.

MONEL METAL

Monel Metal shafts increase the life of hulls or bearing frames, and are especially recommended with Goodrich Colton rubber bearings.
